

Annual Report 1998

**for today
*and tomorrow***

this is Hydro-Québec...

how may I help you?

who are we?

Hydro-Québec is a world leader in generating green energy, with over 31,400 MW of installed capacity in 1998. It also buys most of the generation from Churchill Falls power plant, in Labrador, which has a nominal capacity of 5,428 MW. Hydro-Québec ranks among North America's largest distributors of energy.

Hydro-Québec is a publicly owned company with a single shareholder, the Québec government. It offers multi-energy services to its customers, either directly or through its TransÉnergie division, its subsidiaries, or its strategic partners.

It serves 3.5 million residential, commercial, institutional and industrial customers in Québec. In addition, it supplies nine municipal systems, one regional cooperative and some 15 electric utilities in the Northeastern United States, Ontario and New Brunswick. Since obtaining a marketer's license from the Federal Energy Regulatory Commission, it also makes direct sales, at market prices, to American power wholesalers, including public utilities, municipalities, resellers, and large industrial consumers in the United States.

Its 1998 sales totaled 161.4 TWh, with Québec markets accounting for more than 88% (142.8 TWh), and sales outside Québec for nearly 11.5%.

Hydro-Québec International develops international markets for Hydro-Québec and its subsidiaries in the energy industry and related sectors; exports the technological know-how and products of Hydro-Québec and its subsidiaries; invests in partnerships on the international energy market; and promotes and supports efforts to export the know-how of Québec companies in the energy industry.

Société d'énergie de la Baie James

The Société d'énergie de la Baie James chiefly provides world-class services in engineering and in carrying out construction projects in the energy industry, both locally and internationally.

CapiTech
A subsidiary of Hydro-Québec

In December 1998, Hydro-Québec CapiTech was given a new mission by its Board of Directors. It is now primarily a venture-capital company that invests in enterprises offering energy-related technologies and services.

Energy Marketing
A subsidiary of Hydro-Québec

H.Q. Energy Marketing conducts multi-energy transactions in Canada, including sales, purchases and exchanges at the Canada-U.S. border.

NOVERCO

Noverco, a holding company in which Hydro-Québec has a stake, controls a large number of companies involved primarily in the transmission and distribution of natural gas.

TWh: terawatthour (one billion kilowatthours)

for today *and tomorrow*

L. Jacques Ménard
Chairman of the Board

André Caillé
President and Chief Executive Officer

The profits generated inside and outside Québec through the activities of Hydro-Québec and its partners contribute to economic growth, benefit society as a whole, and enhance the collective wealth that is Hydro-Québec.

Hydro-Québec ended fiscal 1998 with net income of \$679 million, one of the most gratifying performances we have posted in the last five years. This positive result is partly attributable to growth in purchase and resale transactions, increased revenue from energy storage, and careful management of expenses.

When Nature Rebels

The particularly mild weather we enjoyed for most of the year brought down domestic and agricultural power consumption by 3 TWh compared with the averages recorded in the past half-century.

Because of low precipitation, Hydro-Québec turned to various means other than hydroelectric generation to supply power to its Québec customers: these included start-up of Tracy thermal generating station, reduction of sales on short-term markets outside Québec, and electricity purchases on external markets.

A third factor had an impact on 1998 results. That was last January's exceptionally severe ice storm, which caused substantial damage to part of Hydro-Québec's transmission and distribution systems. A number of cities and towns, among the most densely populated in Québec, were without electricity for as long as four weeks in some cases.

Thanks to the hard work and know-how of its employees and the cooperation of all its partners, Hydro-Québec was able to correct the situation with an efficiency that has been commended by numerous observers. According to a survey carried out by the polling firm Sondagem for the news media, 97% of Quebecers said they were satisfied with the way Hydro-Québec had handled the crisis.

Reinforcing the Power System: Investing in the Future

Given the scale of the damage, the Board of Directors charged a committee of 13 internationally respected experts with the task of analyzing the technical aspects related to the ice storm and giving its opinion on the remedial measures planned by Hydro-Québec. Stating that it was "impressed by the efficient organization set up in such a short time in response to such a serious event," the committee chaired by Roger Warren concluded in particular that the events of last January were not in any way connected to a weakness or lack of maintenance of the system; rather, they occurred because the facilities were stressed beyond their bearing capacity by the weight of the ice.

Subsequently, the Québec government established a scientific and technical commission charged with analyzing the emergency plans and the measures taken throughout the incident, particularly by Hydro-Québec and the civil protection authorities. The commission is also responsible for studying the design and reliability criteria for Hydro-Québec's transmission and distribution systems, as well as suggesting ways to avoid such situations in the future. This commission, chaired by Roger Nicolet, is to table its report in April 1999.

Once service was restored, Hydro-Québec set about repairing its grids. In consideration of the urgency of the work to be done, in January Hydro-Québec received permission to go ahead with a series of improvements to reinforce its transmission system.

In December, Hydro-Québec was able to assure its Québec customers that its power lines had been reinforced and it was ready to face winter 1998-1999 with complete confidence.

The considerable efforts expended to ensure the reliability of our power systems attest to our commitment to maintaining a secure power supply and a high level of service for our customers at all times.

Holding Course

In spite of the events of January 1998, Hydro-Québec remains committed to the growth and profitability orientations laid out in its *Strategic Plan 1998-2002*.

For example, we have undertaken to apply stable, uniform rates throughout Québec and to keep them at their current level until 2002 for all customer categories. We plan to fulfill this promise mainly by managing our operating expenses very carefully and by developing the new markets that are accessible to us.

In an industry undergoing worldwide restructuring, we must act immediately to establish effective means of dealing with increasingly fierce competition. We are therefore working resolutely to develop

our electrical generation and transmission capacity so that we can meet the growth in demand in Québec while taking advantage of the business opportunities offered by neighboring markets. We intend to derive additional revenues from developing multi-energy products and services.

The forecast growth in sales between now and 2002 is approximately 20 TWh: 14 TWh in Québec, resulting largely from the establishment and expansion of large industrial concerns, and 6 TWh outside Québec. To achieve this objective, we have built up a diversified portfolio of projects that can be carried out at a competitive cost, principally by completing the development of Québec's hydroelectric potential.

Within the parameters set with Newfoundland and Labrador Hydro, we are continuing discussions about harnessing the remaining hydropower potential of the Churchill River in Labrador. Developing this potential would involve an investment of some \$10 billion over 10 years, and would create nearly 50,000 person-years of employment in Québec and Newfoundland during construction. It would add 3,200 MW of capacity to the two generating systems, enabling both utilities to serve their local markets better and take advantage of the business opportunities afforded by neighboring markets.

As clearly stated in our strategic plan, generation projects must meet three essential criteria.

- First, the projects must be favorably received by Aboriginal and local communities. To this end, we held discussions throughout the year with community representatives to reach partnership agreements that are mutually satisfactory.
- Second, the projects must also be acceptable from an environmental standpoint. Hydro-Québec has adopted an approach which goes beyond strict preservation of the local environment to foster the promotion and development of resources at its future installation sites.
- Third, all new projects must be shown to be profitable under market conditions.

Expanding Our Traditional Markets

In a rapidly changing environment that holds as many challenges as business opportunities, we plan to continue developing profitable activities in partnership with companies whose investment capacity or expertise complements our own.

We intend to expand our relations with partners on neighboring markets, particularly in Ontario and the Northeastern United States, where our low production costs and development of multi-energy projects give us a distinct competitive edge. Hydro-Québec now has official status as a power marketer, which opens up exciting prospects on the U.S. market.

Partnership, the Key to Lasting Growth

Hydro-Québec also made significant progress in consolidating its presence on international markets. Over the year, Hydro-Québec International (HQI) and its subsidiaries added many new projects to their books, as both investors and service providers.

In addition to laying the groundwork for a productive partnership with the Québec Federation of Labor (QFL) Solidarity Fund and with Gaz de France, HQI has developed a network of international partners in a score of countries. To allow for economic fluctuations, HQI subjected all its commitments to especially stringent risk-management criteria.

Hydro-Québec CapiTech is strengthening its financial position, after first redefining its orientations and rationalizing its portfolio of subsidiaries. Previously a holding company comprising several Hydro-Québec subsidiaries, HQ CapiTech has now become a value-added venture-capital company with a mission to exploit technological expertise and products developed by Hydro-Québec, or related to its activities in the energy industry.

Hydro-Québec's research institute, IREQ, has reassessed its priorities and will work in partnership with private companies or other organizations to carry out research and development projects, particularly in fields linked to Hydro-Québec's core activities.

Greeting the Year 2000 with Confidence

The major organizational and administrative changes accompanying Hydro-Québec's new business focus have now been completed. We are intent on the objective stated in our strategic plan, namely to stabilize our work force at 19,500 employees and ensure that it represents an optimum combination of the know-how acquired over the past decades and the various types of expertise that correspond to the new realities of our industry.

The cutting-edge technologies made available to employees include the first four modules of SAP R/3, a software program that will incorporate all data, systems and applications in use at Hydro-Québec and facilitate decision making and the adoption of new business practices.

In 1998, Hydro-Québec completed most of the preparations for Year 2000 readiness of its computer systems. In the coming year, we will conduct validation tests and make the necessary adjustments to ensure a smooth transition to the new millennium for Hydro-Québec's customers and employees.

The accelerated development of our business environment prompted us to establish a new department whose mandate is to carefully evaluate, in conjunction with all other corporate units, all forms of risk to which Hydro-Québec is exposed and, if need be, develop ways to mitigate their impact on the company and its customers.

1998: Mission Accomplished!

In view of the particularly demanding circumstances under which Hydro-Québec operated in 1998, we wish to pay special tribute to all those who enabled the company to fulfill its mission.

We first want to thank our customers and suppliers, as well as all the individuals, companies and other organizations whose tireless efforts enabled us to restore power to our customers as quickly as possible in the wake of the January ice storm.

We also wish to acknowledge the remarkable spirit of mutual aid that was demonstrated in the communities affected by the power outages. Together with the authorities and volunteer organizations, each municipality took the necessary steps to ensure that no one was left alone and that no one's life or health was at risk.

We would like to single out the invaluable contribution of our employees who, at the height of the storm, showed courage, competence, dedication and solidarity, demonstrating a sense of responsibility far beyond the call of duty. All year long, faced with the profound changes taking place within the organization, they gave concrete proof of their loyalty through their daily commitment.

We owe our gratitude to Guy Chevette for his support and cooperation throughout his mandate as Minister of State for Natural Resources, and for his determination in helping us work toward our objectives.

We also wish to thank Georges Pelletier and Charles Sirois, who left the Board of Directors in 1998.

Finally, we acknowledge the outstanding role played by the Board of Directors. Their enlightened vision of Hydro-Québec's development, their unfailing sense of responsibility, and their judicious decisions enable us to provide our customers with the energy they need, today and tomorrow, at the best possible cost and under the best possible conditions.

the year's highlights

January

5 From January 5 to 9, Québec experiences the worst ice storm in its history. As a result of the damage caused to Hydro-Québec's transmission and distribution systems, nearly 1.4 million customers are without electricity.

15 HQI is awarded a US\$180-million contract by the government of Peru to head a consortium in charge of building and operating an interconnection between Peru's northern and southern power grids.

23 Hydro-Québec charges a committee of experts, chaired by Roger Warren, with the task of advising the Board of Directors on 1) the suitability of the improvements and remedial measures planned to consolidate the transmission and distribution systems, 2) transmission system operating methods and strategies, and 3) management of the effort to restore service in an emergency situation.

27 The Québec government authorizes Hydro-Québec to begin construction of three new transmission lines to reinforce the systems supplying the Montérégie and Outaouais regions and downtown Montréal.

27 Hydro-Québec gives its subsidiary HQ CapiTech a mission to invest as a partner in companies involved in energy technologies and related products and by-products.

February

10 Hydro-Québec signs a 22-year contract with Alcan to supply 350 MW of power, along with an energy purchase contract for up to 725 MW.

12 HQI concludes a financial partnership agreement with the QFL Solidarity Fund to invest \$1.5 billion in international energy projects between 1998 and 2002.

March

3 The Québec government authorizes preliminary studies and draft designs for the construction of Tabaret and Toulnostouc generating stations and for the partial diversion of the Rivière Mégiscane.

9 The Québec and Newfoundland governments announce the start of formal negotiations between Newfoundland and Labrador Hydro and Hydro-Québec to conclude an agreement for completing the hydropower development of the Churchill River, in Labrador, and for related projects in Québec.

19 HQI inaugurates a 10.6-MW hydropower plant in Rio Lajas, Costa Rica, built in partnership with a Costa Rican firm.

April

1 The reservoir at Sainte-Marguerite-3 generating station is impounded.

May

1 Hydro-Québec is accredited by the Northeast Power Coordinating Council, whose standards for electricity service provision are among the most stringent in North America. This accreditation confirms the reliability and efficiency of Hydro-Québec's transmission system.

July

21 Hydro-Québec and Gaz de France, partners in MEG International, invest in the construction of the first two service stations in a planned natural-gas fueling network for converted buses in the Valley of Mexico.

24 TransÉnergie U.S. secures an initial contract for a feasibility study on the construction of a direct current underwater link between Connecticut and Long Island by the Long Island Power Authority.

June

2 At a meeting of the E7, of which Hydro-Québec is a founding member, major electric utilities from eight industrialized countries establish international guidelines for sustainable development.

3 Hydro-Québec tables its proposal with the *Régie de l'énergie* (Energy Board) concerning the terms for establishing and applying electricity supply rates.

12 Hydro-Québec and Teqsim International conclude a \$1.4-million agreement to supply a power-system simulator to the Instituto Costarricense de Electricidad, in Costa Rica.

13 H.Q. Energy Services (U.S.) joins the New England Power Pool.

25 The first in a series of horizontal-axis wind turbines to be connected directly to Hydro-Québec's distribution system, each with a capacity of 750 kW each, come on line in Saint-Ulric-de-Matane.

August

18 Hydro-Québec awards four prizes recognizing effort and success in its program of awards for excellence for Aboriginal college students.

24 Hydro-Québec begins construction of the new Aqueduc-Atwater-Viger overhead transmission line, which will strengthen power supply to downtown Montréal.

September

8 HQI, in partnership with a Senegalese-Canadian consortium, is awarded a \$24.2-million contract to carry out a turnkey project in Senegal involving the sale, transportation, installation, start-up and financing of a 37.4-MW thermal generating station.

October

8 The Atomic Energy Control Board renews the operating license for Gentilly-2 generating station for another two years.

November

19 HQI joins with the QFL Solidarity Fund and the American firm Coastal Power to acquire Fortuna, the largest hydroelectric generating station in Panama with an installed capacity of 300 MW.

December

11 Hydro-Québec announces the commissioning of the 315-kV Aqueduc-Atwater line, which will improve the security of power supply to downtown Montréal. In addition, the new 315-kV Duvernay-Anjou line will bolster supply to downtown and east-end Montréal in emergency situations.

18 HQI reaches an agreement with Australia's NorthPower for co-ownership of a direct current interconnection which will link two existing grids in the states of Queensland and New South Wales. TransÉnergie will supply technical expertise for the system's construction and operation.

I'm working for you

"What do I like about my job?
Feeling that I'm doing
something useful, something
people appreciate."

home comfort

Keeping the social pact it made with Quebecers in 1962, Hydro-Québec reiterates its commitment to maintaining low, stable, uniform rates for all customer categories, while constantly improving service quality.

Service on Call

To improve access to services, Hydro-Québec undertook a project to set up a call centre. The centre will actually have five locations, networked to form a single entity, and will operate under the name of HydroDirect, the new banner that now designates the utility's customer services. The first call centre site was opened in Saint-Hyacinthe on September 10, 1998. The others (in Montréal, Québec City, Saint-Antoine, and Hull) will gradually start up operations between now and summer 2000.

A payment collection centre, also with five physical locations, will be gradually set up during 1999 and 2000 to improve collection of amounts owed the company while ensuring fair treatment of customers. Sites are planned at Trois-Rivières, Thetford Mines, Valleyfield, Joliette, and Montréal.

Both centres will field customer calls and forward them to the employee most qualified to respond to the customer's needs. While fostering harmonization of the company's business practices and reducing customer service costs, the centres will also contribute to maintaining jobs in all regions of Québec and facilitate employee development with a view to continuous improvement of service.

Technology to Benefit the Customer

Already in the forefront of information technology use, Hydro-Québec pursued its efforts to develop new applications to enhance the efficiency of its facilities.

For example, the company worked on the development of smart meters that will gradually replace existing units. These remote-programmable devices will allow Hydro-Québec to check the accuracy of its metering equipment at all times. Smart meters will also offer our business customers an expanded range of services and help them manage their electricity bills with greater flexibility.

In the realm of home automation, the utility conducted a pilot project last winter in more than 400 households in the Saguenay region, designed to evaluate the customer benefits of well-planned automation of home heating systems.

Optimizing Energy Consumption

Hydro-Québec continued to promote the benefits of responsible energy management to its Québec customers by keeping them informed in a variety of ways. The newsletter *HydroContact*, with a circulation of 3,480,000, gives suggestions for energy conservation.

Hydro-Québec also renewed its efforts to make contractors aware of the many advantages of the *Nouveau confort* program, which helps increase the energy performance of new homes and yields savings of up to 50% on residential heating costs.

The utility continued its promotion of Iso-Therm 3000 electronic thermostats, which offer energy savings along with enhanced comfort by keeping room temperatures more constant.

*Major events such as the January ice storm are not included, as these events are considered exceptional and non-recurring.

a new regulatory framework

Reorganization of Operating and Distribution Centres

The reorganization of the Operating and Distribution Centres (ODCs) was completed in 1998. The number of ODCs was reduced to five, compared with eight in 1997, resulting in annual savings of \$3.5 million. Management team efforts and consideration for union concerns made it possible to attenuate the impact on employees and keep long-distance travel to a minimum. In addition, early retirement packages were offered to facilitate the adjustment.

During the year, two major submissions were tabled with the *Régie de l'énergie* with a view to obtaining the opinion of the Québec government. The first concerns electricity rates, the second the development of wind energy in Québec.

In accordance with Section 167, paragraph 1, of the *Act respecting the Régie de l'énergie*, Hydro-Québec presented a proposal in February 1998 on ways to establish and apply its electricity supply rates. This proposal, arising out of the orientations of the Québec Energy Policy, was stated in Hydro-Québec's strategic plan, which was approved by the Québec government. It aims to regulate electricity generation on the basis of price and establish the initial price for Hydro-Québec's acquisition of supply.

After holding public hearings, the *Régie* recommended that the government reject Hydro-Québec's proposal and, instead, maintain cost-based regulation of generation. On receiving this opinion, the Minister of Natural Resources announced that he would analyze the impacts of the recommendation before making a ruling.

With respect to the place of wind energy in Québec's energy portfolio, the *Régie* recommended that the government set an annual quota of 50 MW of installed capacity, to be integrated into Hydro-Québec's resource plan. The development of wind energy will be the subject of a nine-year program (three phases of three years each),

beginning in 2002. The *Régie* also recommended that the cost of this energy should not exceed 5.8 cents per kilowatthour and that the government should cover the difference between this cost and the benchmark cost of hydropower generation.

January 1998

From January 5 to 9, 1998, southwestern Québec was struck by an ice storm of exceptional intensity, scale and duration. According to Environment Canada, up to 100 mm of freezing rain fell on southern Québec during those few days. The weight of the ice, coupled with strong winds, damaged some 600 km of transmission lines and 3,300 km of distribution lines. Nearly 1.4 million customers were without electricity for periods ranging from a few days to about four weeks.

the worst storm

Due to the gravity of the situation, Hydro-Québec put a record number of employees from all across Québec on alert the day after the storm hit. The company also mobilized power suppliers and electrical contractors, and requested assistance from electric utilities in the other Canadian provinces and the United States, the civil protection authorities, the Canadian Armed Forces and the police departments of a number of

The damage caused by the storm called for a new approach to managing the transmission system. Throughout the power failure, the company adopted special load management measures, such as cyclical load shedding, to restore supply to customers who had been without electricity for several days, and it asked the entire population to reduce consumption during peak hours. It also obtained the cooperation of its large-power customers (5,000 kW or more) in freeing up energy to supply priority loads. A number of temporary links were made to expedite restoration of service to the major centres.

In four weeks, thanks to the initiative, innovative abilities and dedication of employees and others who came to lend a hand, the Hydro-Québec crews in the field, supported by engineering, geomatics and computer technology specialists, repaired some 3,300 km of distribution lines and 600 km of transmission lines. The work crews' autonomy, flexibility and rapid intervention helped speed the safe restoration of service and reassure those who were without power.

All through the state of emergency, Hydro-Québec strove to maintain constant, direct contact with the public and provide an exact picture of the situation as it developed. Hydro-Québec also issued repeated calls for caution through the news media. By the end of the crisis, general public satisfaction with Hydro-Québec had reached 96%.

municipalities. At the peak of the outage, nearly 10,000 people were at work in the field.

Thickness of ice, by region,
at the height of the storm (in mm)

An experience no one wants
to relive

TransÉnergie submitted recommendations to the Québec government to reinforce the power system in the areas with the greatest ice buildup, specifically by looping three lines in the high-voltage system and building an interconnection with Ontario. All the company's units reviewed their emergency intervention strategies to make them even more effective.

Source: Environment Canada

in history

The committee of experts headed by engineer Roger Warren, which Hydro-Québec's Board of Directors had asked to assess the validity of the improvements and measures planned to reinforce the transmission and distribution systems, agreed with the proposed projects and made a number of suggestions. A further task of the committee was to give its opinion on transmission system operating methods and strategies and on the management of service restoration in emergency situations. The projects proposed by the company were the subject of extensive discussions regarding the ideal sites for the new installations.

The scientific and technical commission set up by the government to analyze the events surrounding the ice storm began its analysis in May 1998 and commissioned numerous studies. Public hearings also gave Hydro-Québec, along with organizations and individuals from a variety of fields, an opportunity to speak about their experiences during the storm. The commission's mandate, which was to be completed by the end of 1998, has been extended to 1999.

In 1998, the ice storm had a direct financial impact of about \$725 million.

The Québec government has agreed to pay Hydro-Québec the equivalent of the net value of equipment destroyed and to reimburse up to \$200 million of the expenses incurred in implementing the emergency measures.

security right down the line

The ice storm of January 1998 had a major impact on the activities of TransÉnergie. The extent of the damage to the transmission system called for new approaches, as ways were sought to restore power as quickly as possible to customers affected by the outage.

Some 40 rebuilding projects were immediately started. In addition, TransÉnergie was able to call upon its network of interconnections with neighboring systems to speed up restoration of service in certain regions.

In its repairs to the system, TransÉnergie applied stricter ice-loading standards wherever appropriate, to lessen the impact of any similar events in the future. In all cases, TransÉnergie selected the solution that best reconciled the imperatives of speedy power restoration, structural sturdiness and cost.

The experts at TransÉnergie also perfected operating techniques such as thermal de-icing, which may come into use in winter 1998-1999 on lines with voltages ranging between 120 kV and 315 kV.

TransÉnergie began construction of new infrastructures to diversify power supply to strategic load centres in areas with a high risk of ice accumulation, notably

by looping the high-voltage systems in three regions and building an inter-connection with Ontario.

Altogether, TransÉnergie invested \$403 million in 1998 to repair and reinforce its high-voltage transmission system, especially in regions affected by the ice storm. This amount includes \$42 million in expenses incurred for emergency measures, which the Québec government has agreed to reimburse.

Transmission System Reliability

At the beginning of May 1998, the Northeast Power Coordinating Council (NPCC) confirmed that TransÉnergie's transmission system complies with all NPCC reliability criteria, which are among the most stringent in North America. This accreditation corroborates the reliability of the TransÉnergie system; it is also of strategic importance to Hydro-Québec's growth, since it lifts restrictions and adds 250 MW to 400 MW to the company's export capacity to the Northeastern United States, depending on the time of year.

The Continental Energy Market

In addition to strengthening the transmission system, Hydro-Québec continued to develop potential markets for its services in the context of North American deregulation. To heighten its presence in the United States, TransÉnergie set up a subsidiary in Boston, TransÉnergie U.S., under the new holding company H.Q. TransEnergy Inc., which has a mandate to develop and manage TransÉnergie's non-regulated activities.

operation loop

at December 31, 1998

Looping the high-voltage systems increases the number of lines supplying power to areas with high risk of ice buildup.

With the downtown Montréal loop via the 315-kV line connecting Atwater substation and Aqueduc substation, which has been in partial service since December 1998 and will be completed in 1999, the downtown area will have additional transmission capacity of 1,000 MW available.

The 735-kV line linking Hertel substation in La Prairie and Des Cantons substation in Val-Joli will be able to supply Montréal's South Shore (Montérégie region) and Hertel substation with an addi-

tional 2,000 MW from a separate source by winter 2000-2001. As of mid-December 1998, the necessary equipment was in place to restore power supply to Saint-Césaire substation from Des Cantons substation in less than two weeks, if need be.

And the new 315-kV line connecting Grand-Brûlé substation and Vignan substation will add some 1,000 MW from a separate source to the transmission capacity of the grid serving the Ottawa Valley (Outaouais region).

In project reports submitted to Québec's ministry of environment and wildlife, Hydro-Québec undertook to comply with existing

standards and agreements. Because there was not much time to conduct impact studies for the construction of new lines and substations, Hydro-Québec adapted its information and consultation processes to the circumstances. A direct form of participation and the formation of technical committees have opened up discussions with the local authorities and principal stakeholders with a view to reaching an optimum solution for the regions concerned.

energy without borders

In 1998, in keeping with its strategic orientations, Hydro-Québec ensured an adequate power supply and continued to develop its markets in Québec as well as in neighboring provinces and states.

Diversifying Sources of Supply

Because of the importance of hydropower in Hydro-Québec's total generating plant, fluctuations in runoff can lead to business opportunities, but at the same time they constitute the greatest business risk we face. In 1998, the Energy Services Group took various steps to ensure an energy supply that meets the reliability and security criteria established in 1991. These criteria state that the company must be able to deal with a two-year loss of inflows amounting to 64 TWh, the equivalent of the largest consecutive deficits recorded in the past.

In 1998, Hydro-Québec increased security of supply by starting up Tracy thermal generating station, reducing sales of Québec-generated electricity on the short-term market outside Québec, and optimizing its energy resources through purchase options.

Developing the Large-Industry Market

The company stepped up development of its activities targeting large Québec-based industrial concerns, for example by offering multi-energy services. During 1998, Alcan agreed to buy a minimum of 46 TWh over 22 years at the large-power rate to supply its new aluminum plant in Alma, scheduled to come

on stream in June 2001. Hydro-Québec in turn contracted to purchase, on attractive terms, up to 725 MW of the power and energy generated by Alcan's Saguenay-Lac-Saint-Jean facilities.

Hydro-Québec also concluded an agreement to supply 3.5 TWh at the large-power rate for 20 years to Iron Ore of Canada for the mining company's pelletizing plant in Sept-Îles.

Increasing Sales Revenues outside Québec

In 1998, Hydro-Québec sold 18.6 TWh of electricity on external markets, including 3 TWh to the neighboring provinces of Ontario and New Brunswick. Total sales outside Québec generated revenues of \$814 million, an increase of 36.6% over the preceding year. This rise in sales outside Québec is mainly the product of an increase in lucrative purchase-resale transactions on external markets.

The company also continued building a structure to support its commercial activities outside Québec. It created the subsidiary H.Q. Energy Marketing, which acts as a holding company and whose mission is to conduct energy transactions in Canada, including sales, purchases and exchanges at the Canada-U.S. border.

In July 1998, the new subsidiary asked the National Energy Board for a blanket permit to export more power and energy from all Canadian provinces to the United States over the coming years. Hydro-Québec already holds a blanket permit to export up to 4,300 MW of power and up to 30 TWh of energy annually from Québec to the United States.

In addition, Hydro-Québec created H.Q. Energy Services (U.S.), with offices in Pittsburgh. The mission of this subsidiary is to carry out energy-related transactions with companies close to American load centres. It is also responsible for marketing the energy generated outside Québec in the coming years under the thermal supply program laid out in Hydro-Québec's strategic plan.

At the end of 1997, H.Q. Energy Services (U.S.) obtained a license from the American authorities allowing it to act as a power marketer and sell electricity at market prices in the United States. This status provides it with direct access to the wholesale electricity market. The subsidiary also became a full member of the New England Power Pool, which comprises some 125 industry members (producers, transmitters, energy marketers, etc.) in New England, and of PJM, a similar organization covering Pennsylvania, New Jersey and Maryland. And it took steps to become a member of the New York Power Pool. By joining such associations, the subsidiary is involved in drawing up the rules governing the new electricity market, while also developing its business network in the United States.

making the most of our water resources

To assure its Québec customers of a reliable power supply and a high quality of service at a competitive price, Hydro-Québec must develop Québec's hydroelectric potential.

Hydro-Québec's growth and the resulting economic spinoffs throughout Québec depend substantially on the utility's generating capacity. At the end of 1998, the installed capacity of all its generating facilities, including the Churchill Falls power plant in Labrador, totaled 36,828 MW. Energy capability under average runoff conditions amounted to approximately 187 TWh annually.

The company has conducted extensive studies to expand its generating plant and meet growing demand in Québec reliably and at competitive rates. A further goal is to achieve the leeway needed to take advantage of our competitive edge on external markets.

Optimizing Facilities

To improve efficiency and extend the useful life of certain structures, Hydro-Québec continued its refurbishing program at the following generating stations: Shawinigan-2 and Shawinigan-3, La Gabelle, La Tuque, Bersimis-1, Manic-2, Chelsea, Rapides-Farmers, and Beauharnois. Hydro-Québec also considered a plan to replace the existing Grand-Mère plant with a new facility. In addition, the utility resumed operations at 600-MW Tracy thermal generating station. Major efforts were put into dam safety, notably in helping draft the government's new legislation in this regard.

Hydro-Québec studied various rivers that could be further developed to quickly increase the output of existing generating stations at competitive costs.

It also established a unit to manage business subsidiaries under the responsibility of the Generation group to ensure the marketing of their products, services and expertise, both nationally and internationally.

Major Potential to be Developed

The Sainte-Marguerite reservoir was impounded sooner than expected, in April 1998. Construction of the Sainte-Marguerite-3 dam was completed in August, midway through building the generating station, spillway and head-race tunnel. To date, this project has injected more than \$340 million into the local economy, and the spinoffs should reach some \$450 million by the end of the project.

Hydro-Québec began operations to return two generating stations to service: Sept-Chutes, with a capacity of 20 MW, and the 5-MW Chute-Bell facility. Work on these two projects, which were favorably received by the local communities, will be completed in 1999.

Preliminary studies on other projects proceeded; in fact, Québec has significant potential in terms of sites that can be developed at competitive costs.

The project for completing the hydropower development of the Churchill River, in Labrador, and related projects in Québec reached an important stage with the launching of formal negotiations with Newfoundland and Labrador Hydro, based on the parameters announced March 9, 1998. Discussions on this project and several others in Québec are continuing with the communities concerned.

All projects must be profitable and meet environmental requirements. Favorable reception by Aboriginal and local communities remains an essential goal for Hydro-Québec. To involve communities more directly in its projects, Hydro-Québec has proposed a partnership approach that will enable them to benefit from substantial economic spinoffs.

Hydro-Québec has also put forward a formula encouraging the exchange of information with local communities, from the time preliminary studies begin, in order to learn their concerns and benefit from their knowledge of the local environment.

Diversifying Sources of Power

Hydro-Québec has undertaken to diversify its sources of power production. In accordance with the requirements of the new Québec Energy Policy, the company has taken steps to divest, at fair market value, sites and generating stations with a capacity of 50 MW or less. Following public hearings to be held in 1999, the *Régie de l'énergie* will give the Québec government an opinion on the share independent power

producers should hold in Hydro-Québec's resource plan, as well as on the price to be paid for the electricity.

In the area of renewable energies, Hydro-Québec inaugurated its wind power test facility at Saint-Ulric-de-Matane. The new installations will be used to test the performance of wind turbines and study ways to integrate this form of energy into the existing grid.

The company is also examining projects for building thermal power plants outside Québec, in particular to protect against fluctuations in runoff. In its strategic plan, Hydro-Québec announced its intention to add 10 TWh of thermal capability to its generating plant by 2002. The energy produced could be sold to American customers or transmitted to Québec if need be.

together

we can do more

“My co-workers,
employees in companies
here and around the
world, investors, people
from local communities —
they’re all partners.”

value-added investments

In the energy industry, venture capital is becoming a strategic tool that offers advantageous access to emerging technologies.

It is able to provide attractive returns through constant monitoring of technological developments.

Hydro-Québec CapiTech: A Promising Turnaround

In 1998, Hydro-Québec completely reorganized its technology subsidiaries to ensure their contribution to the company's continued leadership in technology. Seven strategic subsidiaries, previously held in HQ CapiTech's portfolio, were placed under the responsibility of Hydro-Québec business units. HQ CapiTech began the process of divesting some of its holdings

and turning around a number of others. New investments or reinvestments were made in some of the companies in its portfolio.

HQ CapiTech brought its activities in line with the orientations of Hydro-Québec's strategic plan by focusing on energy and opting for a partnership approach to investment.

Beyond its role as an investor, HQ CapiTech has positioned itself as a value-added venture-capital company, helping make Québec a hub of the

venture-capital market specializing in energy-related technologies in North America. While 1997 was a transition year, 1998 saw the subsidiary acquire the means needed to reach its objectives. HQ CapiTech ended the year with a profit of \$1.6 million, compared with cumulative losses of \$59.8 million in 1996 and 1997, not including the results of Cedars Rapids Transmission Company.

Pooling Resources and Expertise

HQ CapiTech concluded a number of partnership agreements during the year. It formed its first major partnership with the QFL Solidarity Fund by creating two energy financing and investment funds with a total value of \$130 million, under the name Énergie Capital. HQ CapiTech also established a special collaborative relationship with Hydro-Québec's world-renowned research institute, IREQ, which performs technology audits on its proposed investments.

An investment in an energy-related venture-capital fund was concluded with Nth Power Technologies. This step is one in a series intended to achieve HQ CapiTech's objectives in terms of venture-capital partnerships in Québec and beyond its borders, particularly in initiatives that monitor technological developments.

Domosys was refinanced with major partners: SOFINOV, the Société générale de financement and the QFL Solidarity Fund. M4 Technologies got off to a new start, and a promising investment was made in the Société des Technologies de l'Aluminium (S.T.A.S.).

Lastly, HQ CapiTech improved its internal processes and consolidated its management team. It also adopted a corporate governance policy and drew up an investment policy.

Marketing of Technologies, Rationalization, and Promising Investments

Hydro-Québec carried out an extensive rationalization of its patents and marketing licenses, canceling them where the royalties were unsatisfactory, collecting arrears and dropping unpromising patents. It reiterated its confidence in M3i and increased its stake in that venture; it can now ensure better follow-up and greater vigilance in management practices. Other promising projects include the ACEP polymer-electrolyte battery, a technology Hydro-Québec further developed during the year and which is about to make a breakthrough with its first commercial applications.

"A Beetle with an elastic power plug. The tires repair themselves automatically," explains Vanni Lussier, age 8 1/2. The budding artist's vision of the electric vehicle was shown at the symposium on electricity and the future on October 15.

To profit from their telecommunications assets and expertise, Hydro-Québec and Bell Canada reached an agreement for the January 1999 creation of Connexim, a joint venture that will offer outsourcing of internal telecommunications network management to large and mid-sized companies. Connexim will generate new revenue for the two partners and will create advanced-technology jobs in a high-potential area of the telecom industry. In fact, it already anticipates significant increases in the next few years to its work force, which now stands at 500.

IREQ and LTEE: incubators for innovation

In accordance with the orientations in Hydro-Québec's strategic plan, IREQ (Hydro-Québec's research centre) and LTEE (the electrotechnology research laboratory) embarked on a rigorous process designed to reevaluate their practices and bring them closer to their customers and markets. With this in mind, IREQ held a forum on technological challenges and business opportunities, bringing together some 400 researchers, research managers and R&D users from a variety of backgrounds.

In the last 30 years, Hydro-Québec has invested some \$2 billion in its research laboratories, IREQ and LTEE. Over that same period, the company developed more than 200 inventions, obtained close to 1,500 patents and about 100 licenses, half of which are still active, and made several million dollars' worth of sales under license. It produced a significant number of innovations that ensure the reliability of Hydro-Québec's power system.

Fiscal 1998 was full of accomplishments. Following the ice storm in January, an ambitious R&D program for transmission and distribution was launched. One section of this program, line de-icing, was the subject of major research efforts: ice making and de-icing tests, thermal de-icing

of the first commercial application of the Droskar process in France, development of baseboard heating units for residential use, and research on two new

using the Joule effect in conductors, thermal de-icing of ground wires, and failure analysis. Patent applications were filed, and a mechanical tool for gradually de-icing ground wires was designed.

The laboratories were busy, as well, with a study on static compensator behavior, start-up

processes — plasma-assisted wet oxidation and high-density infrared — to name only a few achievements.

IREQ and LTEE also delivered several innovative products related to generation, transmission and distribution technologies.

experts on the world stage

HQI's activities generate considerable economic spinoffs for the Québec economy.

Hydro-Québec International, Investor and Developer

In its *Strategic Plan 1998-2002*, Hydro-Québec gave its subsidiary HQI a new mandate, namely to invest on international energy markets. The company will provide HQI with \$1.2 billion in investment capital over the period covered by the plan. As well, in February 1998, HQI and the QFL Solidarity Fund concluded a financial partnership agreement under which the Fund will invest \$500 million over five years in projects with HQI, raising the total investment capacity to \$1.7 billion.

During 1998, equity commitments totaling \$137 million went to the acquisition of companies and the construction and operation of new energy facilities.

A Dynamic International Presence

In January 1998, HQI secured a \$240-million contract to build and operate an interconnection between Peru's northern and southern power grids. To carry out this project, the consortium headed by HQI awarded an engineering, supply and construction contract to Hydro-Québec subsidiary SEBJ (Société d'énergie de la Baie James), and an operation and maintenance contract to TransÉnergie, the Hydro-Québec division responsible for electricity transmission.

Elsewhere in Latin America, HQI commissioned a 10.6-MW power plant in Costa Rica, built in partnership with a Costa Rican firm and two Québec companies. The project also involves the construction of a 34.5-kV transmission line approximately 10 km long.

In partnership with the American company Coastal Power and the QFL Solidarity Fund, HQI negotiated the acquisition of a 300-MW hydroelectric generating station in Panama.

This project is of major strategic importance since it gives HQI and its partners a key role in a planned interconnection between Central American countries.

In other energy transmission undertakings, HQI reached an agreement with Australia's NorthPower for co-ownership of a direct current interconnection that will link two grids in the states of Queensland and New South Wales. TransÉnergie will supply technical expertise for the system's construction and operation.

HQI made its first investment in the United States through its subsidiary MEG International (Multinationale de l'électricité et du gaz). This project involves building a gas-fired power plant on the site of the Champion International Corporation paper mill in Bucksport, Maine. The plant is slated for commissioning in the year 2000. The electricity generated is intended for Champion International Corporation, to supply its mill operations, and for H.Q. Energy Services (U.S.), a subsidiary of H.Q. Energy Marketing, which may sell it on the open market.

Lastly, in partnership with Dessau-Soprin, a large Québec engineering firm, HQI established Éconoler International. The mission of this new

business venture is to invest world-wide in the creation of companies providing ecological energy services and specializing in projects that reduce energy consumption. Éconoler's first project is now under way in Tunisia.

Profiting from Our Services

The ice storm of January 1998 had a sizable impact on the activities of the Projects and Construction Division, which contributed to efforts to restore and reinforce the power system and worked on the transmission system loop projects in the Montréal, Montérégie and Outaouais regions.

Strict cost control and innovative technical solutions have yielded savings of some 6% on the costs of this division's various projects.

To ensure the growth of Hydro-Québec's International Affairs and Projects Group, the Projects and Construction Division and SEBJ, a subsidiary of Hydro-Québec, now act jointly as strategic advisors for investments in plant and equipment. They also offer engineering and management services for energy-related projects in Québec and all over the world.

twenty years of international recognition

In addition to its new status as an investor, HQI pursued the mission it has fulfilled for the last 20 years: selling professional services and technologies around the world. In 1998, professional services in the form of technical assistance, training and management for energy generation, transmission and distribution projects brought in revenues of \$21 million.

In Asia, HQI was awarded a contract by Atomic Energy of Canada Limited (AECL) to train Chinese specialists in maintaining Candu nuclear generating stations. This contract follows the one previously signed with AECL for the training of some 230 Chinese specialists in the fields of nuclear plant management, operation and maintenance, as well as technical support. These two contracts are worth a total of \$14 million. HQI also supplied technical assistance in the form of equipment to be used in the construction of a control centre for the Bangladesh Power Development Board in Bangladesh.

In Africa, HQI was awarded a \$24.2-million engineering, supply and construction contract for a new 37.4-MW thermal generating station in Senegal, along with a contract to train operating personnel for this plant, which will run on natural gas. HQI signed another contract, with the Cameroon national power authority, to study the behavior of the retaining structures at Song Loulou hydroelectric development, one of the largest in Africa. It also carried out studies for rehabilitating the distribution system in Huambo, Angola. As well, HQI conducted a rate study in Benin and renewed its cooperation agreement with STEG, the Tunisian gas and electric utility.

In the Middle East, HQI obtained a contract from Kuwait's ministry of electricity and water. The assignment is essentially to assist the ministry in evaluating tenders for metering, prepayment and remote-reading systems for electricity and water meters. HQI will oversee the installation of these systems.

In the Caribbean, HQI's technical assistance contract with Électricité d'Haïti was extended to cover upgrading the electricity generation and distribution system in the province of Jacmel. The agreement also includes technical marketing assistance.

In Europe, following the extension of its contract to refurbish hydroelectric generating stations and modernize the control centre for Ukraine's national power system, HQI won a new contract to carry out projects, administer contracts, train engineers, and provide other technical assistance.

In Central America, HQI, in collaboration with Teqsim International, a subsidiary of Hydro-Québec's TransÉnergie division, concluded an agreement worth nearly \$1.5 million to supply a power-system simulator to the Instituto Costarricense de Electricidad in Costa Rica.

the Y2K bug?

we've got it covered

"I'm crazy about computers.

My aim is to make life easier for all

Hydro-Québec employees who use

a computer. I'm needed everywhere."

on the threshold of a new millennium

Employees contribute to the growth and profitability of Hydro-Québec through their relations with the company's customers and partners and through their involvement in developing and promoting its products and services.

To achieve its growth and profitability objectives, Hydro-Québec continued to introduce management tools and practices adapted to the new orientations in its strategic plan.

Rallying Employees: A Corporate Objective

After several years of rationalizing its work force, the company completed the reorganization of its senior management administrative structure and the streamlining of certain areas of activity. It also put into effect a new code of decision-making powers establishing management rules that are better suited to a complex, changing environment.

Conditions for first-line managers were harmonized with those for the company's other managers, which are based on results delivered and the achievement of individual and corporate targets.

In employee relations, Hydro-Québec set up a joint working committee with the Canadian Union of Public Employees, which represents over 70% of the company's employees. To ensure the establishment of a true social contract, this committee was assigned a twofold mandate: to provide each administrative unit with the necessary resources at the appropriate work places, a process that was more than 80% complete by the end of 1998, and to contribute to the company's transformation and growth, an undertaking that will begin in 1999.

Hydro-Québec again conducted a survey in 1998 to understand its employees' concerns. While the general satisfaction level fell from 1995, we nevertheless note that average satisfaction with the 17 expectations judged most important by employees rose, particularly with respect to increased responsibility, recognition and empowerment for employees.

In view of the rapid changes in technology and the company's operating environment, Hydro-Québec continued to optimize its management of training activities, an endeavor begun the year before. As a result of the major steps taken, training resources were stabilized at 378 person-years, down 43% from previous years. Training expenses totaled \$61 million, or 4.1% of total payroll.

Also noteworthy in 1998 was the utility's reduced rate of work accident frequency, which was 18.56 accidents per million hours worked. This 43.1% reduction in the accident frequency rate is attributable to a 40.3% decrease in the number of incidents despite a 5% increase in the number of hours worked.

At the end of December, Hydro-Québec's work force totaled 20,446, slightly exceeding the target set for 1998. This was mainly due to the need for additional personnel to reinforce the transmission and distribution systems following the damage caused by January's ice storm. In accordance with the strategic plan, the company is maintaining its target of closing the year 2000 with a total work force of 19,500, to be adjusted subsequently in line with corporate growth.

A Management System in Harmony

To support its growth objectives, Hydro-Québec introduced new management tools; for example, it is replacing its 150 or so computer systems with SAP R/3, a set of integrated software programs offering data-sharing capabilities. Implementation of the *Harmonie* project will accelerate the re-engineering of processes while facilitating decision making and promoting the integration of better business practices for its approximately 6,000 users.

language guidelines

In 1998, as part of the revision of corporate guidelines, the main orientations of the language policy adopted at the end of 1997 were integrated into the corporate governance policy.

Hydro-Québec's standing committee on language met twice in 1998. The committee's endeavors dealt mainly with formulating a directive for the application of the *Charter of the French Language*. This directive was approved in November.

The proposed policy and directive were intended to fulfill the company's obligations under the government's policy concerning the use and quality of French in public administration. The final version of the guidelines was conveyed to the *Office de la langue française*.

Hydro-Québec also provided the *Office de la langue française* with its annual report on the application of the policy on the use of French in information technologies.

Transition to the Year 2000

In 1998, Hydro-Québec adjusted its computer systems to ensure that the transition to the year 2000 will not cause any inconvenience to customers or employees. An inventory was drawn up of all products deemed critical. Because reliability of the power supply to customers is all-important, particular attention was paid to systems used to manage transmission and distribution. Changes were made to more than 2,500 information systems and approximately 15,000 computers, as well as the 895 models of automatic devices installed on the transmission system and in generating stations.

Products certified Year 2000 compliant will undergo integration tests scheduled to end in mid-1999. Since 1997, Hydro-Québec has been requiring that its suppliers take the necessary measures to ensure that their computer systems are ready for this changeover.

a heritage to protect and develop

At the seventh annual E7 Summit, Hydro-Québec reiterated its firm commitment to environmental preservation and endorsed proposed international standards for sustainable development. The E7, an organization comprising the eight largest utilities in the world, plays an active role in protecting the environment and promoting the generation and rational use of electricity.

In Québec, efforts to restore service and increase the reliability of the transmission and distribution systems following the ice storm in January 1998 were undertaken with constant care for protecting the environment. The urgency of the situation led Hydro-Québec to

establish new approaches to environmental studies in close cooperation with all the government departments concerned, and to ask the government to streamline its public consultation process.

For the utility's generation projects, new processes for public information and consultation were also developed. These include information and discussion panels designed to maintain relations with local community representatives from the time preliminary studies begin.

The many consultations with Aboriginal and local communities, conducted with a view to maintaining an ongoing dialogue, enabled Hydro-Québec to pinpoint the environmental issues raised by its generation projects and determine the best ways of integrating the planned installations into the host environment.

Beyond the usual measures for mitigating the impact of its projects, Hydro-Québec worked with communities to develop local resources and project sites. In 1998, as part of the Sainte-Marguerite-3 project, Hydro-Québec gave out grants of nearly \$4.5 million for six environmental enhancement projects and two regional development projects,

including improvements to the Gallix ski hill, construction of an interpretive centre in Port-Cartier for learning about the Rivière aux Rochers salmon, and construction of a community centre in the town of Lac-Daigle.

A Commitment to Sustainable Development

Hydro-Québec continued implementation of an environmental management system in compliance with ISO 14001 and developed tools for reporting annually on its environmental performance. Consequently, in addition to strictly managing the operation of its facilities, Hydro-Québec is acquiring the means to integrate the environment into its decision-making processes at every stage in the development, start-up and management of its products, services and plant.

The recognition of hydroelectricity as renewable, green energy at the national conference of Canadian environment and energy ministers in October 1998 is of strategic importance in the effort to control the greenhouse effect.

Hydro-Québec continued to participate in the Environmental Commitment and Responsibility Program of the Canadian Electricity Association (CEA). Under this program, which the company joined in 1997, each participant is committed to implementing an environmental management system consistent with the internationally accepted ISO 14001 standard by the year 2002 and to report annually to the CEA on its environmental performance as measured by common indicators. As of December 31, 1997, Hydro-Québec's performance compared favorably with the overall performance of member utilities, especially in terms of energy conversion efficiency and atmospheric emissions of carbon dioxide (CO₂), sulphur dioxide (SO₂) and nitrogen oxides (NO_x).

In 1998, the company published its third environmental performance report, which presented the principal achievements of 1997 and outlined the main environmental issues and challenges faced. The report confirms Hydro-Québec's excellence in this field and its determination to continue rigorous environmental management.

The desire to protect resources can also be seen in our pursuit and development of systematic recovery operations designed to maximize the reuse and recycling of waste materials. According to a report covering 1997 and part of 1998, these operations generated over \$15 million in revenue, plus substantial savings. Reuse and recycling apply to a wide variety of fields: large-scale sale of metals, vehicles and lead batteries; reconditioning of electrical equipment and reinstallation on the power grid; recovery of cut timber from the site of the Sainte-Marguerite reservoir; recycling and reuse of thousands of printer cartridges; recovery of hundreds of tons of paper; recovery and recycling of tons of glass, metal and plastic; composting of several dozen tons of food waste; large-scale recovery and processing of hazardous solid and liquid waste; and recovery, reuse and recycling of some 20% of distribution poles. And the company has used over 8 million litres of reclaimed oil in its transformers in the past two years.

Hydro-Québec reached a milestone in the management of hazardous waste in 1998 with the completion of its polychlorinated biphenyl (PCB) disposal plan. All PCB-insulated units, which had been removed from the power system over the years and stored, were disposed of.

In addition, Hydro-Québec increased its efforts to advocate the use of hydroelectricity as a way of controlling the greenhouse effect. To this end, it helped found the Canadian Hydropower Association, whose mandate is to promote the comparative advantages of this energy option. Hydro-Québec also takes part in the activities of the International Energy Agency and the World Commission on Dams, which establish environmental guidelines for the construction of new hydroelectric facilities.

do I think I can change the world? you bet!

“I’ve always found it important to help the people around me. Changing the world is something you do little by little and day by day.”

partner in the growth of Québec society

Our activities as a whole serve to enhance the value of Québec's greatest collective resource — Hydro-Québec. The company also contributes to the development of organizations whose mission is to improve the lives of all Quebecers.

Hydro-Québec is concerned about making a significant contribution to the economic, social and cultural growth of the society in which it operates, and ensuring the sustainable development of resources. As the manager of collective resources, it has a duty to play a dynamic role in fostering the full development of Québec society.

Hydro-Québec accomplishes most of its social mission through the economic activity it generates and the resulting benefits enjoyed by Québec society as a whole. As well, in supporting a large number of non-profit associations and organizations and sponsoring events throughout the province, it contributes to the social and cultural development of communities.

The total budget for community involvement is approximately 1% of the average of the following: net income produced in the two previous years, anticipated net income for the current year, and forecast net income for the next two years. For 1998, this amount came to \$8.8 million.

Support for Associations and Organizations

Contributions of a philanthropic nature were given in the form of money or material goods to non-profit organizations in the areas of education, health and humanitarian aid.

In education, the company provided support to universities in all regions of Québec, principally by contributing to their basic funding. It also sponsored a dozen research chairs in fields related to its activities, such as the environment, electricity, electrochemistry and hydrology. It supported a research program in small-business management at the Université du Québec à Trois-Rivières, along with a Concordia University program in home automation and building automation. In addition, the company awarded scholarships to university students at the undergraduate and post-graduate levels.

In the health field, Hydro-Québec continued to work with the Québec health-care research fund, in order to take advantage of this organization's expertise to evaluate the research programs the company wishes to encourage. In 1998, Hydro-Québec supported research activities focusing on mental health, children's health, and the environment, and will offer awards for excellence to researchers working in these fields.

Hydro-Québec supported community organizations working to help those in need all over Québec. Areas of special focus were organizations devoted to youth housing and literacy, as well as food banks and organizations specializing in mental health or in home visits to the elderly and isolated. The utility also gave various material goods to organizations dedicated to reintegrating young people into society through job training.

In 1998, Hydro-Québec was still the largest donor to Centraide in Québec, thanks to increased

participation by employees and pensioners, whose contribution was then matched by the company's donation. The total contribution amounted to \$3,104,548, a new high. Hydro-Québec extends its thanks to employees and pensioners for their generosity.

To encourage employees to volunteer for causes close to their hearts, Hydro-Québec initiated a program called PRISE, under which they can receive up to \$1,000 to help an organization carry out a community project of a socioeconomic nature.

Sponsorships

Québec culture remained an important area of sponsorship for Hydro-Québec, which provided financial support to a number of events throughout Québec.

The company sponsored a variety of activities to foster the growth of French-language song, among them the competition *Ma première Place des Arts*, the *Week-ends de la chanson*, the *FrancoFolies de Montréal*, the 10th *Prix Miroir* French-language song awards that are a part of Québec City's summer festival, and the June 24th gala also held in Québec City.

Also in music, it supported the international festival in Lanaudière for a third consecutive year. And it was associated, for the fourth year in a row, with the international voice competition in Trois-Rivières.

Hydro-Québec provided assistance to business organizations that contribute to regional development or to increasing Québec's visibility and influence beyond our borders. For the first time, the company joined the sponsors of the Access 51 directory, an initiative of the Businesswomen in Action Committee of the Board of Trade of Metropolitan Montréal to promote the recruitment of women on corporate boards of directors.

In addition to including concern for the environment in its decision-making processes and involving Aboriginal and local communities in the environmental assessment of its projects, Hydro-Québec gave priority to supporting projects oriented toward sustainable development. It maintained its commitment to the protection and enhancement of its built heritage and the use of its facilities and property by third parties, so long as plant reliability, security and profitability are not compromised.

report of activities of the Board of Directors

The Board of Directors is composed of a maximum of 16 members appointed by the Québec government for terms of no more than five years, as well as a President and Chief Executive Officer appointed by the Board with government approval. The Deputy Minister of Natural Resources is an ex officio, non-voting member of the Board.

The Board of Directors met 13 times during the year, with an attendance rate of over 70%. The Executive Committee held 16 meetings, while the other committees held 29 in all.

With a view to sound corporate governance, the Board regularly monitored the progress of Hydro-Québec's strategic plan as well as its business plan, objectives and the financial results of each of the subsidiaries in which the company is sole shareholder.

and principal committees

Audit

The main role of the Audit Committee is to assure the Board of Directors that the financial statements are in order, that internal controls are adequate and effective, and that suitable mechanisms are being applied to identify and manage the major internal and external risks to which the utility is exposed. The committee reads the internal audit reports and the action plans resulting from recommendations by the unit responsible for internal controls and the General Auditor.

In 1998, this committee monitored, for the second year in a row, the progress of work toward Year 2000 compliance and installation of SAP R/3 software to replace 150 computer systems throughout the utility. It also studied preventive maintenance of overhead distribution system equipment, management of energy supplies, and internal communications. The committee continued to review receivables of more than \$1 million.

Finance

The main role of the Finance Committee is to advise the Board on matters of finance, especially the annual financing program, borrowing, management of corporate funds, insurance, the business plan and ensuing annual budget, and the impact of inflation, interest rates and exchange rates on the company's forecasts.

In 1998, the committee examined the annual financing program, as well as issues relating to risk and insurance management. It also conducted an in-depth analysis of the business plan and corporate objectives for 1999 and studied the frame of reference for integrated business risk management and related elements: the 1999 action plan on integrated business risk management, the portfolio of major risks and the evaluation of major risks arising out of current economic conditions.

Human Resources

The main role of the Human Resources Committee is to advise the Board on matters of hiring, total compensation, training, succession planning and other subjects, including the hiring, appointment, annual performance review and compensation of the President and Chief Executive Officer and other senior management staff.

In 1998, the committee recommended that the Board adopt the human resources management policy, and studied various issues related to corporate structure and to management and employee compensation.

Ethics and Corporate Governance

The Ethics and Corporate Governance Committee ensures that the utility is well managed in accordance with the highest standards of ethics and corporate governance and with laws and regulations. The committee also advises the Board on the application and follow-up of the Code of Ethics for Directors and Executives of Hydro-Québec. It formulates recommendations on rules of conduct governing the operation of the company's business.

In 1998, the committee recommended that the Board adopt policies on corporate governance, Hydro-Québec's relations with its business partners, and the acquisition of goods and services. It also recommended the adoption of the Code of Ethics of Hydro-Québec International. Finally, the committee drew up a review procedure enabling the Board to assess its own performance and its members to appraise their individual contributions.

Environment and Corporate Social Responsibility

The primary role of the Environment and Corporate Social Responsibility Committee is to advise the Board on environmental management, public health and safety, relations with Aboriginal communities, social responsibility and corporate image. The committee receives all reports and violation notices related to environmental incidents.

During the past year, the committee recommended the adoption of policies on the environment and the company's social role. It studied the environmental performance assurance program and examined the environmental performance report submitted to the Board.

Pension Fund Management

The pension fund management committee was established to advise the Board on investment management, portfolio performance, evaluation of portfolio managers and the management of the pension plans, including changes in pension obligations.

In 1998, the committee recommended that the Board adopt the revised version of the policy on the management of pension fund investments, and that the pension plans of four nationalized companies be merged with the Hydro-Québec pension plan. It also reviewed the performance of the pension plan portfolio and specialized portfolio managers, as well as the investment strategy for 1999.

1.1 The January Ice Storm

The ice storm had material consequences for the company's activities and accounts. All units were mobilized to respond to the urgency of the situation and to subsequently implement long-term corrective measures. These extraordinary circumstances resulted in substantial costs and forced us to review our plans for 1998.

The financial impact of the ice storm includes the cost of emergency measures, the investments required to promptly return power to customers and repair installations, as well as the business losses related to electricity sales. The Québec government has undertaken to assume all costs related to the emergency measures and the portion of the required investments corresponding to the net cost of restoring the system to its condition prior to the disaster. The Québec government has accordingly applied to the federal government for financial assistance.

The \$182 million in expenses incurred in 1998 under emergency measures is mainly related to clearing and repair costs and to additional purchases of fuel oil and electricity. This amount will be reimbursed no later than December 31, 2002.

To promptly restore power to customers and repair installations, we invested \$456 million in rebuilding the transmission and distribution systems. The Québec government has granted compensation of \$235 million, which corresponds to the net cost of restoring the system to its condition prior to the ice storm. The portion of investments exceeding the compensation granted, or \$221 million, is borne entirely by the company. The compensation will be paid in two phases: from 1998 to 2002, the annual payments will range from \$10 million to \$11.2 million; the balance will be paid in equal annual installments of \$36.5 million until 2007.

The Québec government has also granted Hydro-Québec compensation with respect to financing costs assumed by the company for the investments. These costs were based on a fixed financing rate of 7.2%. An annual amount of \$16.9 million will be received over 10 years.

Overall, the compensation granted by the Québec government will ensure that additional costs related to the ice storm are not passed on to customers through electricity rates.

The business losses related to electricity sales are borne entirely by the company. These losses amount to \$84 million, of which \$72 million is related to sales in Québec and \$12 million to sales outside of Québec. The losses comprise the following items:

- reduced demand during power outages;
- higher-than-normal credits granted for service interruptions related to power or fixed charges, depending on the type of customer.

Lastly, as part of a mandate given Hydro-Québec by the civil protection authorities, the Corporation initiated the *Généralistes* mission in January 1998 to ensure access to emergency generators to restore essential electricity service. In cooperation with Emergency Preparedness Canada and the Canadian Armed Forces, Hydro-Québec made 570 generators available to the public, in particular to farmers, strategic industries, hospitals, shelters and school boards. At the end of the mission, it was agreed to maintain a permanent stock of generators to meet emergency situations.

1.3 Instability in Financial Markets

The financial crisis that began in Asia in July 1997 continued to leave its mark on the global economic situation in 1998. The economic instability resulting from the crisis affected the entire world economy, and the tremors were also felt in the company's financial results. Despite the effects of unfavorable market fluctuations in relation to last year, integrated financial risk management enabled us to reduce the situation's negative effect on net income by more than 40% compared with last year, to the point where the impact did not exceed \$100 million.

The Corporation has used an integrated approach to managing its financial risk for several years. Our risk management strategy is aimed at optimizing the risk-return ratio between flows related to currency, interest-rate and aluminum-price fluctuations, and the company's ability to withstand uncertainty related to its results. In the event of favorable market movement, this strategy enables us to maximize potential gains, while limiting, in the reverse situation, the maximum loss to the level established by the Board of Directors at the beginning of the year.

Canadian Dollar Exchange Rate in relation to the U.S. Dollar

Market instability resulted in the appreciation of the U.S. dollar, viewed as a safe-haven currency, in relation to most other currencies. The negative impact was particularly felt in countries that export natural resources, including Canada, with the Canadian dollar hitting an all-time low in 1998.

The sharp fluctuation of the Canadian dollar in relation to the U.S. dollar in 1998 had consequences for the company, primarily in terms of financial expenses arising from the portion of long-term debt denominated in U.S. dollars and from the sales the company makes in that currency. As a result of the variation in the exchange rate, financial expenses rose by approximately \$200 million over the preceding year. However, nearly 80% of this adverse effect was offset by the increase in revenue from sales and the use of derivative instruments in active management.

Interest Rates

Despite global economic instability, the U.S. economy performed beyond expectations in 1998. A very low inflation rate, coupled with forecasts of an impending economic slowdown, led to an appreciable drop in the long-term price of money. In Canada, we experienced a rise in short-term interest rates over the first eight months of the year in order to support the Canadian dollar on the markets. The rates then declined, reflecting the U.S. trend.

The adverse effect of the change in interest rates on financial expenses, related mainly to the variable-rate portion of our long-term debt, amounts to approximately \$100 million compared with 1997. However, the company took advantage of lower long-term rates to renegotiate more advantageous terms for certain debts and thereby limit the negative impact of the interest rate variation. Gains were also realized, compared with last year, as a result of the use of derivative instruments in short-term active management. The negative effect of the interest rate variation on net income was thus offset by more than 70%.

Price of Aluminum

The worldwide economic slowdown resulted in increased reserves of the main base metals, including aluminum, due, in particular, to reduced Asian demand. The low demand, combined with sustained production, intensified the downward trend in the price of aluminum that began in July 1997.

The electricity the company supplies to certain industrial clients in the metals sector is billed at a price based on the price of aluminum. The deteriorating market prices in 1998 resulted in a loss of revenue of nearly \$40 million in relation to 1997 prices. However, the negative price fluctuation and the effect on net income were offset entirely by the use of derivative instruments.

1.4 Our Position and Actions on Energy Markets

The strategic plan submitted in fall 1997 was approved by the government in 1998. The orientations adopted for 1998-2002 reflect the business opportunities our core activities offer in Québec and the restructuring of the North American energy markets. Hydro-Québec is the key player in the industrial strategy aimed at Québec becoming an energy hub.

We have taken steps to gain a firm foothold in a deregulated market. In 1997, we obtained our license from the Federal Energy Regulatory Commission, through our subsidiary HQ Energy Services (U.S.), thereby gaining access to the wholesale market and allowing us to conclude transactions in the United States under U.S. market conditions. In 1998, among other initiatives, we opened business offices in Pittsburgh and Boston, and entered the New England market directly as a full member of New England Power Pool.

This year, we took advantages of the changes that marked our business environment. For example:

- short-term sales and purchases for resale, on the rise in a highly active deregulated market. On a business basis, the company purchased electricity at low prices on markets outside Québec for sale at higher prices. Unit prices were higher in 1998 for both sales and purchases;
- storage agreements, under which customers outside Québec store in our reservoirs the energy they buy or produce for future use according to their needs. Storage options also ensure they will be able to store energy in the future. These transactions help optimize the value of our reservoirs;
- tolling, whereby one form of energy is converted into another. By recommissioning Tracy generating station, Hydro-Québec was able to offer services to convert fuel oil into electricity;
- purchase options, as instruments for managing energy needs more flexibly in an age of open markets. Purchase options guarantee that we can purchase energy in a specific timeframe without having to commit to a firm process right away. These options allow us to control prices and minimize energy supply risks.

In 1998, the significant growth in revenue from new commercial activities and the increase in energy purchased for resale are tangible proof of our actions. (For further information, refer to Sales outside Québec, Other Operating Income and Other Expenses in the section Electricity Segment Activities.)

The deregulation of the wholesale electricity market also has a downside. Market players are in the learning phase, which increases the risks. In June 1998, runaway prices in the American Midwest, which soared as high as U.S. \$7,000 per megawatthour within a short period, is just one example. Vigilance is necessary and this crisis has proven two irrefutable facts: the material aspect of energy-related operations, which are not only financial, and the importance of sound credit risk management. With this in mind, we are keeping a watchful eye on the agreements we sign to ensure that the transactions are workable and that the energy sold will reach its destination. In addition, we have already instituted credit risk control mechanisms for the counterparties with whom we negotiate on the energy market. Finally, we are diversifying our purchase options portfolio and are dealing only with companies with high credit ratings.

To capitalize on the growth potential from the convergence of the different forms of energy, we adopted the partnership model currently favored by the industry. Our project to construct a cogeneration plant in Maine, in which HQ Energy Services (U.S.) and Hydro-Québec International are involved, marks the first milestone in our thermal-energy supply plan in the United States. In the retail market, our affiliations with Enbridge and other gas suppliers assure us of a timely presence on the deregulated Ontario and U.S. markets.

Finally, we are increasing our growth potential by investing internationally as an industrial partner through our subsidiary Hydro-Québec International.

2 Results

In 1998, Hydro-Québec adopted the new recommendations of the Canadian Institute of Chartered Accountants with respect to segmented information. The analysis of results is therefore presented for the Electricity, Gas, and Expertise and Technology segments. The main components of these segments are shown at the beginning of the analysis of segmented results and are illustrated at the end so as to provide an additional reference to this new method of segment reporting.

2.1 Consolidated Results

Hydro-Québec's consolidated net income totals \$679 million, compared with \$786 million in 1997. Consolidated sales stand at \$8.8 billion, up 4.6% over last year. Total expenditure is also up, to \$5 billion, an increase of 8.7%. Expressed as a percentage of total revenue, the operating margin dipped from 45.8% in 1997 to 43.6% in 1998. Financial expenses rose 3%, to \$3.2 billion.

Comparative quarterly results are reflective of the overall trend for 1998. Activities in the first three months of the year show a \$150-million decline in income over the corresponding period in 1997. This decrease is mainly due to the exceptional events at the beginning of the year, specifically the ice storm and the mild weather. However, the results for the remaining three quarters reveal the efforts that were made: they exceed the results of each of the corresponding quarters in 1997, narrowing the gap to \$107 million.

2.2 Electricity Segment Activities

The Electricity segment is Hydro-Québec's core business and corresponds essentially to the major components of electricity service: the generation, transmission and distribution of electricity. In 1998, these activities were carried out in the company's business units and in the following subsidiaries and affiliates: Churchill Falls (Labrador) Corporation, HQ Energy Marketing, Cedars Rapids Transmission Company, Société d'énergie de la Baie James, and Hydro-Québec International (generating activities).

Firm purchases of electricity amounted to \$269 million, up \$29 million over 1997. The cost of firm purchases from Churchill Falls was \$108 million, while the volume of purchases was up 12%. Purchases from independent power producers amounted to \$125 million, a 23% increase, as a result of the commissioning of five new generating stations and the indexation of prices paid under contractual agreements.

Electricity purchased on the short-term market totaled \$176 million, an increase of \$122 million. Purchases for purposes of resale to markets outside Québec, made during off-peak hours under favorable terms, were more substantial this year.

As for the secure management of our supply, short-term energy purchase options resulted in an expense of \$21 million as amortization of premiums paid. We exercised these options so as to mitigate the risks related to the runoff situation in 1998 and 1999.

Lastly, fuel purchased amounted to \$60 million, an increase of \$34 million. In fact, the actual fuel expense is equivalent to that of the previous year, if the cost of fuel oil resold as part of tolling operations at Tracy generating station is excluded.

Depreciation, amortization and decommissioning

Depreciation, amortization and decommissioning totaled \$1,533 million, compared with \$1,501 million in 1997. This is the lowest increase in ten years, both in relative terms (2.1%) and in monetary terms (\$32 million). The increase this year is explained by the offsetting effect of the various expense components.

Depreciation of fixed assets, which represents 88% of the expense, stands at \$1,349 million, up \$76 million. This change is attributable to the usual change factors for the expense: growth related to prior years' commissionings, the impact of the annual review of the useful lives of our fixed assets and the increase inherent in our sinking fund method of amortization.

However, the decrease in our investments in marketing programs is progressively reducing the corresponding amortization, which was brought down to \$68 million this year, a drop of \$20 million. Amortization of deferred charges related to the portion written off for Grande-Baleine and to the write-off of Nottaway-Broadback-Rupert ends this year, as these charges have been expensed since 1996.

Taxes

The expense related to taxes amounted to \$775 million, up 2.6 %, or \$20 million. The \$11 million increase in capital tax reflects the depreciation of the Canadian dollar, since this tax is based on the company's paid-up capital. The \$7-million increase in the tax on gross revenue is explained by the fact that this expense varies according to the growth of electricity sales in Québec.

2.2.3 Financial Expenses

Interest

Interest expense amounted to \$2,951 million in 1998, compared with \$2,970 million in 1997, down \$19 million or 0.6%.

On the one hand, the unfavorable fluctuation in 1998 financial markets increased interest expense. The rise in the exchange rate for the U.S. dollar pushed up interest expense on debt denominated in U.S. currency. The movements in interest rates, mainly the increase in Canadian short-term rates, had a negative impact on the variable-rate portion of long-term debt. However, the higher short-term interest rates were partially offset by the renegotiation of debt at appreciably lower interest rates.

On the other hand, the use of derivative instruments allowed us to considerably reduce the negative variance resulting from market fluctuations. Moreover, the 1998 debt repayments and the increase in the capitalized borrowing costs on fixed assets in progress yielded a positive variance compared with last year.

Exchange loss

Exchange loss stands at \$137 million in 1998, up \$85 million. This increase is mainly due to two factors. An increase of \$60 million stems from the unfavorable change in the exchange loss amortization expense, explained primarily by the higher exchange rate for the U.S. dollar than at year-end 1997. Losses resulting from the conversion debt securities not hedged by future ongoing revenue streams in U.S. dollars are amortized over the remaining term of the debt securities.

Also, exchange losses associated with debts denominated in U.S. dollars and hedged by continued future revenue streams in that currency exceeded prior-year exchange losses by \$17 million.

2.3 Gas Segment Activities

The Gas segment includes natural gas transmission and distribution activities and comprises, more specifically, Noverco, Novergaz, and our gas brokerage activities.

The \$15-million segment profit recorded this year exceeds that of 1997 by \$4 million. The increase is largely attributable to the effect over the entire year of the proportionate consolidation of Noverco's results. In 1997, the year our investment in Noverco was acquired, the results recorded covered three quarters.

Hydro-Québec has been active in the direct-purchase natural gas market since October 1997. It now ranks fourth among some 30 suppliers to large Québec businesses. This brokerage activity is in line with the company's objective to offer its customers new products. In 1998, this activity generated sales of \$49 million and a profit of \$1 million.

Following the ice storm, residential customers opted to diversify their supply, resulting in a breakthrough for gas in this sector. In addition, the effects of weather on the financial results were evened out by the gas rate stabilization mechanism.

Lastly, we should mention the performance of the investment we made in Enbridge, through Noverco, which has appreciated since our acquisition.

2.4 Expertise and Technology Segment Activities

The Expertise and Technology segment comprises the commercialization of technologies and know-how developed by Hydro-Québec. This year the segment combines Hydro-Québec CapiTech, the expertise activities of Hydro-Québec International, and the holdings of three business units: Gestion Production HQ, HQ TransEnergy and Hydro-Québec Valtech.

The new organizational structure for Hydro-Québec's subsidiaries and investments was implemented in 1998. The distinction was made between subsidiaries and investments deemed strategic and related to the company's primary mission, as opposed to those related to the commercialization of technologies. The transfers were conducted between HQ CapiTech and strategic holdings under the responsibility of the business units.

The Expertise and Technology segment posted a net loss of \$33 million in Hydro-Québec's 1998 consolidated results, compared with a \$45 million loss in 1997. The segment should soon reach the breakeven point.

HQI's expertise services generated a profit of \$1.6 million in 1998, a performance in line with the zero-deficit position targeted at the beginning of the year. This year, HQI provided expertise services to markets in Africa, the Middle East, the Americas, Asia and Europe. The aim for 2002 is a more substantial profit.

HQ CapiTech also closed 1998 with a profit of \$1.6 million, in keeping with the anticipated 1998 profitability target. Relaunched early in 1998, HQ CapiTech oriented its activities as a venture capital investment company and focused investments on the energy sector. One tangible result of these decisions was the creation of Énergie Capital in partnership with the Québec Federation of Labor Solidarity Fund. HQ Capitech plans to pursue its management policy, based on growth and profitability principles, and to continue to improve Hydro-Québec's long-term return.

The business unit holdings are in a deficit position at the close of this first year. In accordance with the new orientations, business unit managers are accountable for the commercialization of technologies and expertise in relation to their unit missions and the financial results of the subsidiaries. Activities in 1998 were characterized by reorganizations and restructurings.

Finally, the segment's contribution to Hydro-Québec's consolidated results for 1998 was affected by prior-year losses of \$17 million. HQI added a \$7-million loss, related to the decline in value of HQI's investment in Morocco. Nouveler, whose activities have been taken over by HQ CapiTech and the holdings of the business units, wrote off additional investments amounting to nearly \$10 million.

3 Financial Position

3.1 Operating Activities

Cash from operating activities totaled \$1,832 million at the end of 1998, down \$540 million, or 22.8%, from 1997.

Cash attributable to income, that is, cash before dividends and change in non-cash items, amounted to \$2,297 million compared with \$2,357 million in 1997, a drop of \$60 million, or 2.5%. Net income, readjusted to add back depreciation and amortization expense, shows additional cash inflows of \$102 million, compared with the preceding year, proof of the company's ability to increase its internally generated funds. However, cash outflows due to the ice storm, which totaled \$182 million and will be reimbursed by the Québec government, are the primary reason for the \$60 million decline in cash attributable to income.

Operating Activities

(in millions of dollars)

	1998	1997	Change 1997-1998
Net income	679	786	(107)
Depreciation of fixed assets	1,383	1,297	86
Amortization of deferred charges	399	276	123
Other	(164)*	(2)	(162)
Cash attributable to income	2,297	2,357	(60)
Dividends and change in non-cash items	(465)	15	(480)
Total	1,832	2,372	(540)

*Includes expenditures of \$182 million related to the ice storm, to be reimbursed by the Québec government.

Moreover, the payment in 1998 of \$357 million of dividends declared at the year-end essentially explains the decrease of \$540 million in cash during the year, as no dividend was paid in 1997.

The self-financing rate for the year is 44.5%, down from last year's rate of 60.4%, primarily due to the decline in cash inflows related to operating activities. However, our ability to generate funds internally is still excellent, since, applied in full to the funds required for investing activities, the rate equals nearly 80% of cash outflows for the year, despite the additional expenditure related to the ice storm.

3.2 Investing Activities

The investment program increased by \$198 million, or 9.3 %, over 1997, to \$2,331 million. The investment mix differs considerably from last year, when the interest in Noverco was acquired for \$482 million. In 1998, investments are lower, but investments in fixed assets increased substantially because of the corrective work made necessary by the ice storm at the beginning of the year.

The following analysis focuses on the Corporation's investing activities and represents substantially all Hydro-Québec's investments.

The investment in fixed assets rose by \$432 million, or 27.8%, to \$1,986 million at year-end. If we exclude the investment in fixed assets related strictly to the ice storm, a decline of \$182 million, or 11.7%, can be seen. This variation is explained by the reallocation of budget appropriations in order to focus efforts on priority projects. Investments to ensure the continued reliability of assets, excluding those investments related to the ice storm, represented half of the amounts invested, compared with nearly two-thirds in 1997. However, if we include this type of investment related to the ice storm, the proportion remains the same as in 1997, or nearly two-thirds of the investment in fixed assets.

Ice Storm

The ice storm required additional investments of \$614 million in fixed assets in 1998. Our priority was to rebuild those sections of the transmission and distribution systems incapacitated by the abnormal accumulation of ice on lines and structures. These were rebuilt to more stringent standards and required investments of \$456 million.

In addition, we undertook major projects, worth \$158 million, in regions hit by the ice storm. Some of these projects, aimed at enhancing our transmission system, will continue through to 2001. The work primarily involves three loop projects and a major interconnection with the high-voltage Ontario grid. Once completed, these projects will provide us with greater flexibility in terms of electrical supply sources and will have cost nearly \$1 billion. In the coming years, we also expect to complete the work to consolidate and strengthen our distribution system, including a program to put distribution lines underground in high-density urban centers. The program will first have to be submitted to the *Régie de l'énergie*.

All the distribution projects and more than half the transmission projects were completed during the year. The commissioning of these installations, valued at \$454 million, represents nearly three-quarters of the total year's investments related to the ice storm.

Investment in Fixed Assets

(other than investments related to the ice storm)

In the coming years, we expect to increase energy sales in order to meet the demand of our Québec customers and to benefit from the growth potential in other markets. To support this targeted growth in electricity sales, our investments in installations will largely concentrate on the generation and transmission sectors. This was the focus for investments in 1998. Nearly 60% of amounts invested in fixed assets relate to generation and transmission activities, which alone accounted for capital expenditures of \$820 million. The most important development project in terms of electricity generation remains the construction of Sainte-Marguerite-3 generating station. The dam was completed in 1998 which enabled us to begin reservoir impounding earlier than expected. Capital expenditures amounted to \$251 million. With the commissioning of this generating station, scheduled for 2001, we will add 882 MW of capacity to the current generating facilities.

Investments in Fixed Assets

(in millions of dollars)

	Related to ice storm	Other	Total
Generation	—	525	525
Transmission	361	295	656
Distribution	252	217	469
Other	1	335	336
Total	614	1,372	1,986

The common denominator of other major projects is installation optimization. Various upgrading and rehabilitation projects were carried out, for a total investment of \$247 million. The aim of these projects is to modernize the generating stations and maintain their efficiency, while prolonging their useful lives. In some cases, the work will also boost capacity. This rehabilitation and upgrading program, begun in the early 90s, will continue in the coming years.

An amount of \$295 million was invested in transmission, mainly to improve system continuity and enhance reliability. Specifically, we worked on our transmission system in order to bring it into line with the requirements of the Northeast Power Coordinating Council, whose standards are among the toughest in North America. Because of this work, completed in 1998, certain restrictions on the use of our interconnections were lifted, so we are now able to use our installations at full capacity to transit electricity to the U.S. market. The work to improve the robustness of the entire system, combined with the new interconnections, will support our strategies to develop new markets.

We have invested \$217 million in distribution, primarily to respond to the growing number of customers and to assure continuity of service and installations. These continuity investments preserve the quality of supply, which is key to providing the service to which consumers are entitled and to maintaining customer satisfaction.

Other investments principally involve telecommunication installations, \$132 million, and support equipment, \$186 million, including \$107 million in computer technology. Implementation of the SAP R/3 software package required disbursements of \$58 million in 1998. Once the implementation is completed in 1999, this software package will replace some 150 business systems, modernize management information technology, and facilitate the transition to the year 2000.

Commissionings

The value of commissionings increased slightly, to \$1,539 million at the end of 1998, up \$136 million, or 9.7%, compared with 1997. The increase is the result of major projects made necessary by the ice storm, most of which were completed in early 1998, enabling us to reach our objective of restoring the system in time to confront the winter of 1998-1999. However, when the commissionings related to the ice storm are excluded, a drop of \$319 million, or 22.7%, is noted, matching the trend observed in recent years with the successive commissionings of the large generating stations in Phase II of the La Grande complex coming to an end.

Major upgrading and rehabilitation of hydroelectric generating stations represent the majority of commissionings related to generating activities. In transmission and distribution, projects related to the ice storm represent almost half of commissionings, while the others stem mainly from activities designed to ensure the continued operation of these assets. Finally, commissionings total \$164 million for telecommunications, and \$136 million for support equipment, including \$63 million for computer technology.

Commissionings

(in millions of dollars)

	Related to ice storm	Other	Total
Generation	—	243	243
Transmission	202	328	530
Distribution	252	199	451
Other	1	314	315
Total	455	1,084	1,539

From 1998 to 2002, commissionings will focus on electricity generating and transmission facilities, in line with our program to complete the development of Québec's hydroelectric potential.

3.3 Financing Activities

Activities are financed primarily through funds from operations and borrowed capital. In the years to come, the company plans to finance its investment program through funds from operations in order to gradually reduce the level of its long-term debt.

With a year-end capitalization rate before dividend pay-outs of 25.4%, Hydro-Québec was able to declare dividends of \$279 million to the shareholder. After the dividend payment, the capitalization rate stands at 25.0%, compared with 25.1% in 1997. Over the next few years, we expect to pay dividends representing up to approximately 50% of net income.

Interest coverage remained relatively stable, declining to 1.19 times gross interest expense compared with 1.21 times in 1997. This ratio should show a positive change in the near future as financial expenses are gradually reduced and revenue grows.

teamwork

“Hydro-Québec’s growth is founded on the combined talent and expertise of everyone and on their full commitment to the success of our collective project.”
